AIM

Calculation of response rates for 6-month, 18-month, 4-year, 7-year, 10-year, 13-year and 16 year follow-up questionnaires.

METHODS

For each follow-up questionnaire, we identify the subset of participants for whom at the date of the database download the time of the questionnaire completion was expired (eligible population) and among them we define as respondent a child whose mother started the completion of the index questionnaire.

The response rate is then calculated in the eligible as the ratio of number of respondents over the total number of participants.

In particular completion of the questionnaires expires as follows:

- **6-month follow-up:** more than 24 months from date of conception;
- **18-month follow-up:** more than 30 months from date of delivery, or if the latter is missing more than 36 months from date of conception;
- **4-year follow-up:** more than 59 months from date of delivery;
- **7-year follow-up:** more than 96 months from date of delivery;
- **10-year follow-up:** more than 132 months from date of delivery;
- **13-year follow-up:** more than 168 months from date of delivery;
- **16-year follow-up:** more than 216 months from date of delivery.

Twins are followed-up until the 18-month questionnaire and therefore are not part of the eligible population for the 4-, 7-, 10-, 13- and 16-year follow-up.
